                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                  Producing aromatic acid conjugates, involves contacting glycosylated aromatic acid with malate, alpha-hydrocarboxylic acid or alcohol in the presence of sinapoylglucose:malate sinapoyltransferase.
                                                                                                                                                                                                                                                                                                                                  gene (SNG1, singuoylgiucose accumulator 1) encoding singuoylgiucose malate sinapoyltransferase (SWT). SWT catalyses the sinapoyltransferase (SWT). SWT catalyses the substitution of a glucose molety on a glycosylated aromatic acid with amalate moiety to form a malate conjugated aromatic acid. The enzyme is useful for producing malate conjugated aromatic acids, carboxylic acid conjugated aromatic acids or aromatic esters. The malate conjugated aromatic acids are useful in the synthesis of various polymers. The present sequence representing the ORF (open reading frame) for TP-CPL (tomato Rubisco small subunit precursor for rbc32-Escherichia coli chorismate pyruvate lyses (CPL) fusion protein is described in the examples of the present invention
                                                                                                                                                                                                                                                                                                                  The present invention relates to the isolation of Arabidopsis thaliana
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ATCCCCGAAGAACTGCCGCTGCTGCCGAAAGAGTCTCGTTACTGGTTACGTGAAATTTTG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated nucleic acid that encodes a Upp-
glucosyltransferase. The method of the invention may be used to
transform microorganisms or green plant cells so that these produce a
higher level of high-volume chemicals or materials, such as pHBA (p-
hydroxybenzoic acid) ester glucoside which is an intermediate for pHBA, a
monomer for liquid crystal polymers (LCPs) and starting material for
methylparaben. Methylparaben is a preservative commonly used in the food
and cosmetic industries. The encoded enzymes may be used for in vitro
production of these compounds and for identifying similar enzymes by
sequence comparison. The current sequence is that of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding UDP-glucosyltransferase, useful for preparing cells that produce p-hydroxybenzoic acid glucose ester, also the new

                                                                                                                                                        RESULT 10
                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce arbutin. Plants and microbes can be genetically engineered to produce increased pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-bydroxycinnamoy-CoA hydratases/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is tomato rubisco small subunit precursor (rbc22) transit peptide (chloroplast transit peptide; TP)-Escherichia coli CPL chimeric DNA. This sequence is present in the E. coli expression vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ThrSerSerThrLeuThrArgAspPhelleGlulleGlyArgAspAlaGlyLeuTrpGly 140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                246

The present invention relates to a method of producing p-hydroxybenzoic acid (pHB) which comprises transforming microorganisms with plasmids acid (pHB) which comprises transforming microorganisms with plasmids carying selected genes of the common aromatic pathway and by conversion of carbon sources. The selected genes of the common aromatic pathway of the invention includes ubiC gene encoding chorismate pyruvate lyase, arog structural gene encoding 3-deoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzyme synthase (phP), ttA gene encoding transketolase, ppsA gene encoding phosphoenolpyruvate (PEP) synthase, arof gene encoding chorismate synthase, arof gene encoding s-enolpyruvoylshikimate-3-phosphate (EPSP) synthase and arob gene encoding 3-dehydroquinate (DHA) synthase. The method is used for converting chorismate to a selected aromatic compound. The method is garticularly used for the production of commercially acceptable levels of aromatic compounds, particularly phydroxybenzoic acid. The present sequence is ubiC gene which encodes chorismate pyruvate lyase that
p-hydroxybenzoic acid; pHB; aromatic pathway; carbon source; ubiC; chorismate pyruvate lyase; ppsA; phosphoenolpyruvate synthase; ppsB; ppsB; phosphoenolpyruvate synthase; aroA; psB synthase; tktA; transketolase; aroC; chorismate synthase; aroA; 5-enolpyruvoylshikimate-3-phosphate synthase; BFSP synthase; aroL; shikimate kinase II; aroB; 3-dehydroquinate synthase; DHQ synthase; aroG; 3-deoxy-D-arabino-heptulosonate-7-phosphate synthase; DHAP synthase; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing aromatic compounds, especially commercially acceptable levels of p-hydroxybenzoic acid, comprises developing genetically engineered bacteria that carry selected genes of the common aromatic pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Amaratunga M;

The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid; (phydroxybenzoic acid; pHBA) in a biosyntheetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial phyllievels of phyllievels of phyllievels (PML) or by the expression of 4-bydroxycinnamoyl-Coh hydratese/lyase (CPL) or by the expression of both. Arbutin is useful as an antioxidant, antiacrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The inflammatory agent and inhibitor of carcinogenesis (melanoma). The Escherichia coli chorismate pyruvate lyase (CPL) and Arabidopsis thaliana UDP-glucosyltransferase (UGT72B1) chimeric DNA.
                                                                                                                                                                                                                                                           Producing hydroquinone glucoside in a green plant comprises growing a green plant having nucleic acid fragments and chorismate pyruvate lyase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 3452 BP; 932 A; 730 C; 856 G; 934 T; 0 U; 0 Other;

The present invention relates to a method of producing p-hydroxybenzoic acid (pHB) which comprises transforming microorganisms with plasmids carrying selected genes of the common aromatic pathway and by conversion of carbon sources. The selected genes of the common aromatic pathway of the invention includes ubic gene encoding chorismate pyruvate lyase, arof structural gene encoding 3-deoxy-D-arabino-heptulosonate-7-phosphate (DHAP) isoenzyme synthase (phe), tktA gene encoding transketolase, ppsA gene encoding phosphoenolpyruvate (PEP) synthase, arof gene encoding sene encoding shikimate kinase II, aroA gene encoding 5-dehydroquinate (DHAP) synthase and aroB converting chorismate to a selected aromatic compound. The method is used for converting chorismate to a selected aromatic compound. The method is particularly used for the production of commercially acceptable levels of aromatic compounds, particularly p-hydroxybenzoic acid. The present sequence is pME2 plasmid which comprises ubic, arod, tktA and ppsA genes involved in the aromatic pathway
                                                                                                       160

                                                                                                                                                                                                                                                                                            The present sequence comprises the ubiquinone biosynthetic enzyme genes ubiC and ubiA, which were cloned from the chromosomal DNA of E. coli (Kohara map phage DNA bank IF8 (634); Cell 50, 495-508 (1987)). A large amt. of ubiquinone-10 can be produced by culturing photosynthetic bacteria transformed with the novel plasmid pR&FAC, which contains the ubiC and ubiA genes and the glutamate synthase gene promoter, specifically the Rhodobacter capsulatus transformant MC9R/pRSFAC

The present invention relates to methods and materials to produce hydroquinone glucoside (arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside) in genetically modified green plants and microorganisms. The method relies upon transgenic plants or genetically modified microorganisms that produce increased levels of the initial substrate para-hydroxybenzoic acid; pHBA) in a biosynthetic pathway to produce arbutin. Plants and microbes can be genetically engineered to produce high levels of pHBA either by functional expression of the bacterial protein chorismate pyruvate lyase (CPL) or by the expression of 4-hydroxycinnamoyl-CoA hydratase/lyase (HCHL) or a combination of both. Arbutin is useful as an antioxidant, antimicrobial agent, anti-inflammatory agent and inhibitor of carcinogenesis (melanoma). The present sequence is Candida parapsilosis pHBA 1-hydroxylase (PHB 1-H) and
Hydroquinone glucoside; arbutin; 4-hydroxyphenyl-beta-D-glucopyranoside;
                        chorismate pyruvate lyase; CPL; 4 hydroxycinnamoyl-CCA hydratase/lyase; HCHL; gene expression; hydroquinone; antiseptic; transgenic plant; genetically engineered microorganism; antioxidant; antimicrobial agent; anti-inflammatory agent; carcinogenic inhibitor; melanoma; cytostatic; neoplasm; pHSA 1-hydroxylase; pHBA; para-hydroxybenzoic acid; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Producing hydroquinone glucoside in a green plant comprises growing a green plant having nucleic acid fragments and chorismate pyruvate lyase expression cassette.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein"

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) are to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cultivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cultivity of (II) and its binding partners are useful in medical imaging cultiply in aberrant protein expression or biological activity. The cusponable for generating successivations in colypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponable for genetic disorders or other trails to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this coling sequences of the invention. Note: The sequence data for this coling sequence the printed specification, but was obtained in coling coling appear in the printed specification, but was obtained in coling sequences.
                                                                                                                                                                                                                                                                New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1207 BP; 316 A; 265 C; 288 G; 338 T; 0 U; 0 Other;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Sesued_Patents_NA:*

Sequence 3122, Application US/09543681A

GENERAL INFORMATION:

APPLICANT: GARY BERTON

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABIL

TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: 2009-601

CURRENT APPLICATION NUMBER: US/09/543,681A

CURRENT PILING DATE: 2000-04-05

PRIOR FILING DATE: 1999-04-09

NUMBER OF SEQ ID NOS: 8344
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 507

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -USER=USI0718311 @CGN 11 56 @CUNAL 26052006 164936 13807 -NCPU=6 -ICPU=3 NO MAMP -NEG SCÔRES=0 -WAIT -DSPBLOCK=100 -LONGLOG -DEV TIMEOUT=120 -WARN TIMEOUT=30 -THREADS=1 -XGAPD=10 -XGAPEXT=0.5 -FGAPOP=6 -PGAPEXT=7 -YGAPOP=6 -DELEXT=7
